In this very distinctive book, images of projects challenge how we think about projects in the most fundamental way. It rejects outright the idea of a one-best-way to view all projects and also the idea of following a prescriptive approach in contrast. Images of projects seek to encourage a more pragmatic and reflective approach based on deliberately seeing projects from multiple perspectives. Exploring the insights and implications which flow from these and crafting appropriate action strategies in complex situations based on real examples and the authors work over the last ten years. Images of projects present seven pragmatic images for making sense of the complex realities of projects illustrated using various models. These images are presented in ways that allow the reader to reflect upon their own mental models in relation to the different perspectives in this book.

How such interactions have been altered by anthropogenic impacts and the relative success of efforts to restore damaged ecosystems. This book is designed for use in courses related to aquatic and fish ecology. Fish biology, ichthyology, and related advanced ecology and conservation courses, and is divided into five sections for ease of use. Chapter summaries, supplemental reading lists, online sources, extensive figures, and color photography are included to guide readers through the material and facilitate student learning. Part 1: Faunal origins, evolution, and diversity presents a broad picture both spatially and temporally of the derivation of the fauna, including global and regional geological and climatological processes and their effects on North American fishes. Part 2: Formation, maintenance, and persistence of local populations and assemblages focuses on how local fish populations and assemblages are formed and how they persist or not through time. Part 3: Form and function deals with the relationship of body form and life history patterns as they are related to ecological functions. Part 4: Interactions among individuals and species discusses the numerous interactions among individuals and species through communication, competition, predation, mutualism, and facilitation. Part 5: Issues in conservation focuses on several primary conservation issues such as flow alterations and the increasing biotic homogenization of faunas.

Drawing on twenty-five years of teaching prison college and volunteer classes in eleven Michigan and California prisons, the prisoners' world strives to make the prisoners' voice come alive for regular college students. The book starts off by tracing shifts in social definitions of criminality and lays out the premises of the U.S. incarceration binge in the 1986 War on Drugs laws and subsequent mandatory sentencing and policing. Later chapters discuss issues such as leaving home, cell life, correctional officers, and treatment. The homosexual prisoner and drugs. Furthermore, the book discusses the teachers' experiences via author narrative essays that draw the reader into prisoner-student and prisoner-teacher interaction and what it is like inside prison college classes where both young and older black prisoner students describe growing up in the inner cities. The book also draws upon over sixty prisoner essays that provide insight on prisoner life and self-concept with insights on pathways to prison drug selling, the inner city, and guns. There is also a strong focus on the inside experiences of entering prison and orientation daily work routine, correctional officers, and surreptitious activities like cell cooking and contraband. These essays are capped by prisoner critiques of prison life from those still in the system. The prisoners' world serves as a successful supplemental book whose material has proven useful in undergraduate criminal justice classes as college students themselves on campus students in these classes will identify with the prisoner student voices who share their experiences but in a radically different environment.

The transfer across the surface of environmental waters is of interest as an important phase in the geophysical and natural biochemical cycles of numerous substances indeed it governs the transition one way or the other be tween the dissolved state in the water and the gaseous state in the atmosphere especially with increasing population and industrialization gas transfer at water surfaces has become a critical factor in the understanding of the various pathways of wastes in the environment and of their engineering management this interfacial mass transfer is by its very nature highly complex the air and the water are usually in turbulent motion and the interface between them is irregular and disturbed by waves sometimes accompanied by breaking spray and bubble formation thus the transfer involves a wide variety of physical phenomena occurring over a wide range of scales as a consequence scientists and engineers from diverse disciplines and problem areas have approached the problem often with greatly differing analytical and experimental techniques and methodologies
