Keynes and his Contemporaries 2014-05-09

This book examines how the Cambridge school economists such as J.M. Keynes constructed revolutionary theories and advocated drastic policies based on their ideals for social organizations and their personal characteristics although vast numbers of studies on Marshall Keynes and Marshallians have been published there have been very few studies on the Keynesian revolution or Keynes's relevance to the modern world from archival and intellectual viewpoints which focus on Keynes as a member of the Cambridge school this book approaches Keynes from three directions: Person, Time, and Perspective. The book provides a better understanding of how Keynes struggled with problems of his time and it also offers valuable lessons on how to survive fluctuating global capitalism today. It focuses on eight key economists as a group in a public sphere rather than as a school. A unified theoretical denominator and clarifies their visions and the widespread beliefs at the time by investigating their common motivations lifestyles values and habits.

Essays in Economic Theory, Growth, and Labour Markets 2002-01-01

The distinguished contributors in this volume provide a variety of essays which are written in honor of Emmanuel Drandakis. These essays fall into four uniform areas of economics: Economic growth, General equilibrium, Labor Economics, and Game theory and applications. The editors focus on a select set of issues that stand high on the agenda of academic research. They provide fresh insights and approaches to the analysis of these issues and thus open up wider avenues for our understanding of the dilemmas posed for theory and policy readers are offered new empirical evidence on such thorny social problems as, for example, unemployment, the intergenerational transmission of human capital, and the response of wages to price and endowment changes.

This book consists of a collection of essays dealing with financial markets imperfections and the inability of neoclassical economics to deal with such imperfections. Its central argument is that financial economics as based on

Seminar paper from the year 2006 in the subject Economics industrial economics grade 10 Helsinki school of Economics course Industrial Organisation 18 entries in the bibliography. Language English abstract. The main issue in the article is the derivation of a model in which prices can differ in equilibrium even though the goods are homogeneous and there is asymmetric information in the market. The reason for this price dispersion is caused by consumer heterogeneity. Salop and Stiglitz explain that because of differences in preference or ability, some agents perform much better than others in market decisions. To model this kind of heterogeneity, they assign different costs of gathering certain information to the consumers for...
simplicity they part the consumers in two groups the first one consists of low cost information gatherer and the other group has higher cost to gain complete information for further simplicity there are just two levels of information to be completely informed or to be not informed at all furthermore the costs to become an informed consumer are fixed the differences in information in this model regard the locations of the shops all consumers know about all prices that are in the market they just do not know where the shop with a certain the lowest price is the shops on the other hand have complete information about the market they know about the differences between the consumers and can compute the demand that will occur when they ask a certain price so they face a trade off between higher prices and lower demand it is important to state why there is a possibility of raising the price and not to loose all demand it would be in a perfect market when the rise in price is not too high it does not pay for the high cost information gatherer to become completely informed their expected loss by buying randomly either in low or high priced shops is lower than the fixed cost of gathering the information all together this consumer heterogeneity and the fully informed shops can lead to price dispersion in equilibrium even though the goods are homogeneous and there is the difference in information between the actors

over the past thirty years urban economic theory has been one of the most active areas of urban and regional economic research just as static general equilibrium theory is at the core of modern microeconomics so is the topic of this book the static allocation of resources within a city and between cities at the core of urban economic theory an essay on urban economic theory well reflects the state of the field part i provides an elegant coherent and rigorous presentation of several variants of the monocentric city model as the centerpiece of urban economic theory treating equilibrium optimum and comparative statistics part ii explores less familiar and even some uncharted territory the monocentric model looks at a single city in isolation taking as given a central business district surrounded by residences part ii in contrast makes the intra urban location of residential and non residential activity the outcome of the fundamental tradeoff between the propensity to interact and the aversion to crowding the resulting pattern of agglomeration may be polycentric part ii also develops models of an urbanized economy with trade between specialized cities and examines how the market determined size distribution of cities differs from the optimum this book launches a new series advances in urban and regional economics the series aims to provide an outlet for longer scholarly works dealing with topics in urban and regional economics

The Student's Guide to Writing Economics 2007-06-26

this book presents an in depth novel and mathematically rigorous treatment of the modern classical theory of value based on the spectral analysis of the price profit wage rate system the classical theory is also subjected to empirical testing to show its logical consistency and explanatory content with respect to observed phenomena and key economic policy issues related to various multiplier processes in this context there is an examination of the trajectories of relative prices when the distributive variables change both theoretically and empirically using actual input output data from a number of quite diverse economies it is suggested that the actual economies do not behave like the parable of a one commodity world of the traditional neoclassical theory which theorizes the relative scarcities of goods and production factors as the fundamental determinants of relative prices and their movement by contrast the results of the empirical analysis are fully consistent with
the modern classical theory which makes the intersectoral structure of production
and the way in which net output is distributed amongst its claimants the fundamental
determinants of price magnitudes at the same time however these results indicate
that only a few vertically integrated industries industry core or hyper basic
industries are enough to shape the behaviour of the entire economy in the case of a
disturbance this fact is reduced to the skew distribution of the eigenvalues of the
matrices of vertically integrated technical coefficients and reveals that across
countries and over time the effective dimensions of actual economies are
